

A07 AI and Blockchains Integration Class notes

Crypto currency, Bitcoin– us technologies Block chain tech

-Smart contract utilization is diligent when creating because AI will be used to create smart contract optimization. Smart contract optimization is a new technology that can write smart contracts for the user.

-Altering Smart contracts: AI can predict the outcome and give you the outcomes.

-Fraud protection. An authenticator will be following any unusual logins to detect AI frauds where users can create fraud in a chain.

-Data Market/Monetization: AI monitors the marketplace to track the buyers because the market needs to have trust to sell and buy. AI to govern the marketplace and monitor malicious people in the marketplace.

-Supply Chain Management: Predict, place order, track, enforce rules, alert the systems.

-Identity Verification: AI will monitor each user to understand and verify the user to ensure everything runs smoothly on the platform.

-NRG Efficiency:

-Healthcare: monitoring the blockchains in the hospital records because it enhances its usage with the use of AI meaning more rating and clients.

-Decentralized government: Trying to bring AI chains to monitor the block chains. AI will see the number of transactions that are happening and connect the public data with crime data to track bounties.
